

## Pre-Con Automatic Inlet Valves (PC3 & PC30)

### Automatic Inlet Valves

PC30 Valve

Pre-Con Valves are suction inlet valves designed to operate as automatic flow control valves. This eliminates the need for manual adjustments in relation to water flow.

The Pre-Con 3 & 30 are the choices of the City, States and Military fire departments across the world. Its also used widely in drafting operations because of the automatic check valve action. Suction hose prime water is retained when flow is stopped or switched to booster tank operation. The compact design makes it so no need for remote valve controls . Also can be uses in both front and rear suction inlets.

PC3 Valve

The Pre-Con 30 comes standard with a field adjustable relief valve Large Air purge valve at a stress-relieving 30 degree angle for storz or large NST hoses. The PC-30 only opens as far as necessary for the discharge flow requirements. As discharge lines or nozzles are opened or closed, the PC 30 continually adjust for changes in water flow. The straight-Through design enhances flow and eliminates cumbersome 90 degree elbows that can interfere with pump controls.

Hydra-Shield Manufacturing has been in Business since 1979, and continuing to grow through design and innovation.
